Close rate shift

6 min

Weekly audit

Most sellers fix the wrong thing. They adjust price when they should adjust timing.

When close rate drops, the first assumption is pricing. The second is pitch quality. Both are usually wrong. The real answer is in the transcript — in the exact minute a prospect went quiet, the exact phrase that killed momentum, the silence that got filled with a discount. The problem is that replaying 20 calls manually takes more than a full day. Most people never do it.

Claude changes the math. Drop 20 transcripts into one session, use one prompt, and in under 10 minutes you get: the moment momentum dropped across all calls, the phrases that appear when deals die, and a close-rate score for each call. The pattern across all 20 tells you what to fix. Not one bad call. The consistent leak.

The system has four steps. Run them in order the first time. After that, step four runs automatically every week.

The fix that works: earlier diagnosis questions and a later price conversation. The pitch isn't the problem. The sequence is.

Start with the last 20 calls, not your best memory of them.

Zoom exports the full transcript in two clicks.

Sales coaching advice almost always starts from memory. You remember the call where the prospect pushed back on price, and you adjust for price. You remember the call that felt good, and you call it instinct. Memory edits the story. Transcripts don't.

The Zoom export includes timestamps, exact words, and speaker labels. That's the raw material. In Zoom's web portal: Recordings, then Download, then Transcript. Most other platforms have an equivalent export. Get the last 20 calls as .txt or .vtt files and drop them all into one Claude conversation.

Don't filter before you load. Include the calls you felt good about and the ones you'd rather forget. The pattern lives in the contrast.

EXAMPLE · LOAD AND FLAG THE BATCH

You tell Claude: "I'm dropping 20 sales call transcripts from the past 30 days. Read them in order. Do not analyze yet. Confirm you have all 20 and flag any under 4 minutes — those are probably not real sales calls."

```
$ claude "Load 20 call transcripts..."  
  
[ ] 20 transcripts loaded, timestamps preserved  
[ ] Speaker labels detected: You / Prospect  
[ ] 2 calls flagged under 4 min (calls 7, 15)  
  
— transcript scan —————  
Total calls  20 (18 usable)  
Avg duration 24 min  
Shortest call 3 min flagged  
Longest call 51 min  
Speaker ratio  You 61% · Prospect 39%  
  
— ready —————  
Status  Awaiting coaching prompt
```

Use this when: you're about to analyze a batch. Load all of them before asking anything. Claude holds context across all 20 in one session.

WHAT THIS STEP PRODUCES	WHERE IT BREAKS
+ Exact words from real calls, not memory of them. The transcript doesn't edit for how the call felt.	– Requires a platform that exports text. Audio-only calls need transcription first (Whisper or a service like Otter).
+ Timestamps show when things went wrong, not just that they did.	– Under-4-minute calls are too short to show behavior patterns. Flag and exclude them.
+ Loading all 20 at once means Claude can find patterns across the batch, not just within one call.	– Under 10 usable calls, the batch is thin. The pattern needs volume.

02

STEP 02 · THE DIAGNOSTIC

One prompt. Every call. Three questions.

Where momentum dropped. What killed it. What to say instead.

Most people prompt Claude to "summarize the call." That produces a summary. A summary doesn't help you close. The right framing is a coach, not a scribe. A coach watches the call and answers three specific questions: where did momentum drop, what exact words caused it, and what should have been said instead.

Claude scores each call on a 0–100 close-rate scale based on pattern recognition across the batch. The score is directional, not precise. What matters is the spread: which calls scored 30 and which scored 70, and why the gap exists.

Run this once for all 18 usable calls. Don't ask for one call at a time. The batch is what makes the coaching real.

EXAMPLE · THE COACHING PROMPT

You tell Claude: "Be my sales coach. Review each call individually. For each one: 1. where momentum dropped (give me the minute and the line), 2. my exact words that killed it, 3. what I should have said instead. Then give each call a close-rate score from 0–100."

```
$ claude "Be my sales coach..."

[] Reviewed all 18 usable calls

[] Momentum drops identified per call

[] Close-rate scores assigned 0-100

- call 01 · scored 72 —————

Momentum drop  min 9 "let me know what budget works"

Exact phrase  "we can be flexible on pricing"

Fix  Stay quiet for 8 seconds. Ask: "what makes this the right time?"

- call 04 · scored 28 —————

Momentum drop  min 6 pitch started before pain was named

Exact phrase  "so here's what we do..."

Fix  3 diagnosis questions first. Pitch only after problem is stated.

- call 11 · scored 61 —————

Momentum drop  min 19 "I can do 15% off if you sign this week"

Exact phrase  discount filled the silence

Fix  Silence is not a problem. Wait 10 seconds before speaking.
```

Use this when: all 20 calls are loaded. Run the coaching prompt once across the full batch. The per-call output feeds the next step.

WHAT THIS STEP PRODUCES	WHERE IT BREAKS
+ Exact phrases from your own calls, not generic advice from a sales book.	– Claude scores by pattern, not by outcome. A high-scored lost deal means the call was solid; something external closed it.
+ A score for each call gives you a rank. Work from the bottom up.	– One-sided transcripts (prospect audio missing) produce weaker coaching. Both speakers need to be captured.
+ The three-question structure forces Claude to stay diagnostic, not descriptive.	– The score is not a performance review. It's a diagnostic tool. Don't attach it to self-assessment.

03

STEP 03 · THE PATTERN

Across 20 calls, the same three things keep happening.

The consistent leak, not the bad day.

After Claude scores all 18 calls, ask one more question: what's consistent across the lowest-scoring half? This is where the real fix lives. Not in the worst call. In what every low-scoring call shares.

In the example from this system, three patterns showed up across every low-scoring call: pitching before diagnosis, filling silence with a discount, and speaking 61% of the call. None of those were one-off mistakes. They were habits.

Habits respond to rules, not to motivation. The fix isn't "try harder to listen." It's a rule: no pitch before 3 diagnosis questions. No price before minute 15. No offer before 10 seconds of silence. Rules are specific enough to measure. Motivation isn't.

EXAMPLE · EXTRACT THE ROOT PATTERNS

You tell Claude: "Look at the 9 calls scored under 50. What's consistent across all of them — the same timing pattern, the same type of phrase, the same speaker ratio? Give me 3 root patterns, not 9 individual problems."

```
$ claude "Find root patterns across low-scoring calls..."

[] 9 calls below 50 analyzed for shared patterns
[] 3 recurring behaviors isolated across all 9

- pattern 01 · timing —————
Pitch starts   avg min 6.2 (target: after min 12)
Consequence   Prospect silent by min 9 in 7 of 9 calls
Rule → No pitch before 3 diagnosis Qs answered

- pattern 02 · silence —————
Avg gap       4 seconds then seller speaks
Habit         Discount or concession fills silence in 8 of 9 calls
Rule → Wait 10 full seconds. Ask: "what would make this feel right?"

- pattern 03 · ratio —————
You talk      avg 61% of call
Prospect talks avg 39%
Target       40% you · 60% prospect
```

Rule → After each answer, ask a follow-up before continuing

Use this when: the per-call coaching analysis is complete. The pattern report is the second pass. Don't skip step 02 and jump straight to the pattern.

WHAT THIS STEP PRODUCES	WHERE IT BREAKS
+ Three rules from 20 calls. Rules are actionable in a way summaries aren't.	– Patterns from 20 calls may not hold across 200. Validate against the next 10 before treating them as permanent rules.
+ The root cause, not the symptom. Timing is easier to fix than pitch quality.	– If the low-scoring half is under 6 calls, the pattern is thin. Run the step again after a fuller batch.
+ A week-one change you can track. Write the rules down before next Monday's first call.	– Three rules is the cap. More than three and you can't hold them in mind during an actual call.

04

STEP 04 · THE AUTOMATION

Friday morning. One page. Where you lost money this week.

The audit that runs itself.

Running this once is a diagnosis. Running it every Friday is a practice. The difference between a seller who improves and one who doesn't is the weekly data loop. One batch tells you what's wrong. Weekly batches tell you whether the fix is holding.

The automation is simple: every Friday, pull the week's transcripts, drop them in, and run the coaching prompt. Ask Claude to compare this week's scores to last week's. Are the same patterns recurring? Are the rules holding? Where did a new leak appear?

The output is one page: average score for the week, the pattern that improved, and the one that didn't. Five minutes to generate. Five minutes to read. That's the weekly rhythm.

EXAMPLE · WEEKLY DELTA REPORT

You tell Claude: "Here are this week's 4 transcripts. Use the same coaching framework. Score each. Then compare: did pitch timing improve from last week's audit? Did silence-filling improve? Show me the one thing that got better and the one that got worse."

```
$ claude "Weekly call audit..."

[] 4 calls loaded, scored, compared to prior week
[] Pattern delta computed across both weeks

- this week · avg score 58 —————
Last week avg  44 this week 58 +14

- improved —————
Pitch timing   avg min 10.4 (from 6.2)
Diagnosis Qs   avg 2.8 (from 1.2)

- still leaking —————
Silence gap    avg 5 sec (was 4 sec) no change
Discount habit appeared in 2 of 4 calls persists

- next week rule —————
Focus → Silence tolerance
Target 10 full seconds before speaking
```

Track Note the minute you broke the rule

Use this when: the first audit is complete and the initial rules are set. From that point, this is the weekly check. Run it every Friday before the week's mental model resets.

WHAT THIS STEP PRODUCES	WHERE IT BREAKS
+ Week-on-week comparison makes improvement visible, not just felt.	– Works only when runs are consistent. One skipped Friday breaks the delta. The comparison requires continuity.
+ One next-week rule per Friday. Concrete enough to test on the following Monday's first call.	– Weeks with under 3 calls produce thin data. Flag and note it rather than drawing conclusions from a small sample.
+ Five minutes to generate. The time cost of the audit goes down as the habit stabilizes.	– The audit finds patterns; it doesn't fix them. The rule you write Friday has to carry into the calls next week.

The four steps at a glance

STEP	WHAT IT ANALYZES	INPUT	OUTPUT	SAVES
01 Transc ript load	Raw call data	20 .txt exports	18 usable calls, flagged and ready	2h of manual replay
02 Coaching prompt	Per-call behavior	One prompt	Score + exact phrase fix per call	A week of 'what went wrong?'
03 Pattern report	Cross-call habits	Low-score half	3 root patterns + 3 rules	4h of analysis and guessing
04 Weekly a utomatio n	Week-on-week delta	This week's transcripts	One-page trend report + next rule	60 min of Friday reset each week

The order to run it in.

These four steps work in sequence. The pattern report is meaningless without the per-call data. The weekly automation compounds only when the rules are already set. Each step gates the next.

- **First batch**

Load the last 20 calls and run the coaching prompt. This is the baseline. Everything you track from this point gets measured against it. Don't skip to the pattern before every call has a score.
- **Extract the rules**

From the bottom half, pull three root patterns and write three rules. Specific rules: timing, ratio, silence. Write them down before your next call. These are what the weekly audit will track.
- **First weekly run**

One week later, drop that week's calls and run the coaching prompt again. Ask Claude to compare to the baseline. This is where you see whether the rules are holding or whether the leak persisted.
- **Every Friday after**

Same prompt. Same format. The close rate moves when the rules hold consistently, not when you remember them on a good day. Four Fridays of data shows a real trend. Fewer than that is still anecdote.

How to start.

Start with the calls you ran last week. Not 20. Five is enough to see the first pattern. Export them from Zoom, drop them into Claude, use the coaching prompt from step 02. Read the output for one thing only: what phrase appears in the lowest-scoring call that also shows up in the others.

The score is directional. The exact words are the real output. One phrase from one call that appears in three others tells you more about your sales behavior than a year of coaching advice. That's the habit. That's what you fix this week.

The habit that drops close rate most is almost never pitch quality. It's timing. Price comes up before the prospect has named the problem. Silence gets filled with concessions. Both are fixable in a week with a rule, not a rewrite. The rewrite is what you do once you know which rule to write.

Run the weekly automation for four Fridays before changing anything else. Let the data tell you where you've improved. The sellers who close consistently aren't better at selling. They're better at auditing.

Now do this.

Take the last 3 calls you ran. Export the transcripts from your call platform. If you're on Zoom: Recordings, then Download, then Transcript. Drop all three into Claude as separate files or pasted text.

Then run this exact prompt:

"Be my sales coach. Review each call. Tell me where momentum dropped (give me the minute and the line), my exact words that killed it, and what I should have said instead. Score each call 0–100."

Read what comes back for one thing only: the phrase that appears in the lowest-scoring call that also shows up in at least one other. That's the habit. Write it down. That's what you work on this week.

Reply to this thread with the phrase Claude flagged. One line on what you said and what you're replacing it with. We read every reply.
